

Energy storage power station dispatch type

Overview

What is power system dispatch?

Basically, power system dispatch determines the optimal operation pattern of power grid to meet the power demand, which is a rather broad concept. Take the situation in China as an example, the power system dispatch framework considering the market environment is shown in Figure 3, which is a common trend of power system dispatch.

What are the basic dispatch objects in power system dispatch?

In power system dispatch, the basic dispatch objects are different types of generators. Here conventional thermal generators, renewable power plants, and energy storage are discussed. For conventional thermal generators, the power outputs and on/off statuses are the main concerns.

Are pumped storage power stations a viable alternative to traditional energy systems?

The joint operation of wind, solar, water, and thermal power based on pumped storage power stations is not only a supplement and improvement to traditional energy systems but also a crucial step towards a cleaner, more efficient, and more sustainable energy future.

What is multi-energy joint dispatch based on pumped storage power stations?

Maximizing the role of pumped storage power stations and adopting multi-energy joint dispatch based on pumped storage is a viable approach. Joint dispatch refers to the collaborative work and optimized allocation of different types of energy sources, such as wind, solar, hydro, and thermal power.
