## Overview

---

What is an uninterruptible power supply (UPS)?

An uninterruptible power supply (UPS) is a device that ensures that the load stays powered even if the grid blacks out. On a very simplified diagram, you can see how the direct current standby UPS works. When there is power on a grid, current flows first via an ACDC converter and then via a DCDC converter to the output.

What is a single-phase online uninterruptable power supply (UPS)?

Our integrated circuits and reference designs for single-phase online uninterruptable power supply (UPS) help you design reliable and robust hardware with very low input and output total harmonic distortion (THD) and increased efficiency. Modern single-phase online UPS designs often require:.

Why do we need an uninterrupted power supply for personal computer (PC)?

The design of this uninterrupted power supply (UPS) for personal computer (PC) is necessitated due to a need for enhanced portability in the design of personal computer desktop workstations.

What do you need to make an uninterruptible power supply?

For prototypes, you need a soldering iron, cuprextit boards, wires, solder, flux, and the components listed later. For measurement, you need a multimeter, an oscilloscope, and a thermometer (or thermal camera). Step 1: What Is an Uninterruptible Power Supply?
