Overview

What causes coupling in DC side of photovoltaic inverter?

There are multiple fault causes coupling in DC side of photovoltaic inverter. The changes of voltage, current and power are derived by fault mechanism analysis. The differences of failure feature are used to locate the fault cause.

How do DC faults differ from grid-connected inverters?

Due to the different mechanisms of DC faults caused by different causes, there are obvious differences in characteristic such as voltage and current. Using the fault features of grid-connected inverters, a fault diagnosis process combining multiple technical means is proposed.

What is DC overvoltage fault in inverter?

2.2. DC overvoltage fault The condition of DC overvoltage fault in inverter is that the DC capacitor voltage exceeds maximum allowable voltage U_{max} and maintains for a period of time, which triggers overvoltage protection and causes the inverter to stop.

What is DC/DC converter control method when grid-side inverter adopts VSG control?

Few papers discussed the DC/DC converter control method when grid-side inverter adopts VSG control. To maintain power balance of both sides of the DC-bus, we add a DC-link voltage control loop into the DC/DC converter, as shown in Fig. 7.
