## Overview

---

What is an off-grid solar inverter?

An off-grid solar inverter is a device that converts the direct current output by solar panels into alternating current. It is not connected to the power grid and independently supplies power to the load. This type of inverter is suitable for remote areas with unstable power supply or no access to the power grid.

What are islanding protection features in grid-tied inverters?

The presence of Islanding Protection Features in grid-tied inverters greatly impacts energy production reliability. When grid power is off, these features guarantee that your solar generation system shuts down to prevent sending electricity back to the grid. This interruption in energy production can affect your overall energy efficiency.

What does a grid connected inverter do?

Photovoltaic grid-connected inverters rely on the large power grid to operate. When the power grid is disconnected, the grid-connected inverter will be in an island protection state and stop working. Its main function is to convert solar energy into electrical energy and transmit it through the power grid.

How do grid-tied inverters work during a power outage?

During a power outage, grid-tied inverters can continue to operate using power from the solar panels. This is made possible through innovative inverter technology that allows the system to function independently of the grid. By leveraging this advancement, you can liberate yourself from the constraints of grid dynamics during outages.
