

# Maximum discharge rate of solar container battery

## Overview

---

What is the optimal battery depth of discharge in a solar PV system?

The objective of this research was to achieve the most optimal battery depth of discharge based on the characteristics of a cycling battery in an SSPVB. The results indicate that the optimal DOD value for the battery in the solar PV system being investigated is 70%, with LLP = 0% and COE = 0.20594 USD/kWh.

What is a maximum continuous discharge current?

Maximum Continuous Discharge Current - The maximum current at which the battery can be discharged continuously. This limit is usually defined by the battery manufacturer in order to prevent excessive discharge rates that would damage the battery or reduce its capacity.

How long can a battery be discharged?

Maximum 30-sec Discharge Pulse Current -The maximum current at which the battery can be discharged for pulses of up to 30 seconds. This limit is usually defined by the battery manufacturer in order to prevent excessive discharge rates that would damage the battery or reduce its capacity.

What is the optimal model for battery charging & discharging?

The proposed model includes the depth of discharge (DOD) of the battery, which is determined based on the battery life loss cost. In addition, in the optimal model, the amount of energy flow from the battery bank during the charging and discharging cycles must satisfy the load demand at the lowest cost and with the highest reliability.

## Maximum discharge rate of solar container battery
