## Overview

---

How will a 5G base station affect energy costs?

According to the mobile telephone network (MTN), which is a multinational mobile telecommunications company, report (Walker, 2020), the dense layer of small cell and more antennas requirements will cause energy costs to grow because of up to twice or more power consumption of a 5G base station than the power of a 4G base station.

Is re a suitable power supply for 5G communication networks?

Limited space and far few PV modules are required in 5G systems. Thus, RE is a desirable power supply for such communication networks. The RE sources to power individual SCBSs may face geographical issues.

What is a critical problem in 5G ultra densely mobile network?

It is a critical problem in 5G ultra densely mobile network is to forward the massive backhaul traffic in the core network with guaranteed QoS and a low cost and high EE manner with affordable energy consumption. The signalling load due to a large number of small cells will increase because of frequent handovers and mobility robustness degradation.

Will 5G UDN increase energy consumption in 2026?

As a result, the operational cost of the system will rise, which is a significant concern of the mobile operators nowadays. It is expected that the 5G UDN network will increase the total network energy consumption by up to 150%-170% in 2026 ( Lorincz et al., 2019 ).
