

Profit sharing ratio of energy storage project

Overview

What is the difference between leased and shared energy storage?

In the leased mode, the energy storage is owned by an energy storage company, while the new energy power plant acts as the user. In the shared mode, the energy storage is collectively owned by a consortium of new energy power plants, with the individual plants within the consortium serving as the users.

How much storage capacity should a new energy project have?

For instance, in Guangdong Province, new energy projects must configure energy storage with a capacity of at least 10% of the installed capacity, with a storage duration of 1 h . However, the selection of the appropriate storage capacity and commercial model is closely tied to the actual benefits of renewable energy power plants.

Can energy storage configuration schemes be tailored for new energy power plants?

This paper proposes tailored energy storage configuration schemes for new energy power plants based on these three commercial modes.

Why is energy storage configuration important?

In the context of increasing renewable energy penetration, energy storage configuration plays a critical role in mitigating output volatility, enhancing absorption rates, and ensuring the stable operation of power systems.
