## Overview

---

What G-value should a Photovoltaic Glass have?

Photovoltaic glass can be customized to achieve a solar factor between 6% and 41%. A low g-value is desirable to prevent overheating, especially in warm climates, as it prevents the interior temperature from rising too high due to the greenhouse effect.

What is Solar Photovoltaic Glass?

This article explores the classification and applications of solar photovoltaic glass. Photovoltaic glass substrates used in solar cells typically include ultra-thin glass, surface-coated glass, and low-iron (extra-clear) glass.

Which solar glass products are suitable for thin film photovoltaic technology?

Range of coated solar glass products designed for thin film photovoltaic technologies, including a comprehensive choice of TCO glass (Transparent Conductive Oxide coated glass) products with haze and conductivity levels optimised to suit each specific thin film photovoltaic solar technology, also available on low iron glass.

What are solar glass products?

Available with added functionalities, such as transparent conductive coatings or anti-reflective coatings, our solar glass products not only offer durable transparent protection to solar panels, but also become a functional component of solar modules.
