

The internal structure of solar panels

Overview

The typical construction follows a specific order from top to bottom: protective glass cover, encapsulation film, photovoltaic cells, back encapsulation layer, protective backsheet or rear glass, and aluminum frame with junction box attachment. What are the components of a solar panel?

The most crucial component of the solar panels is the photovoltaic (PV) cells responsible for producing electricity from solar radiation. The rest of the elements that are part of a solar panel protect and give firmness and functionality to the whole. The structure of a solar panel is divided into different parts or components.

What is a solar panel mounting structure?

Within the components that make up a photovoltaic system, the structures of the photovoltaic panels are passive components that facilitate the installation of the solar PV modules. Solar mounting structures must constantly withstand outdoor weather conditions. The solar panel mounting structure fixes its position and stays stable for years.

How do solar panels work?

This solar product works pretty simply: when the cells that make up the solar panels are exposed to solar radiation, the so-called PV effect occurs, which converts photons of sunlight into electrons. That is, it transforms solar radiation into electrical energy.

What is a solar panel frame?

The solar panel frame is the border that surrounds each photovoltaic module. It's typically made of anodized aluminum for a good reason: it's lightweight, rust-proof, and sturdy. The frame keeps the glass, solar cells, and backsheet in place while offering a rigid base that can be easily mounted on different surfaces.
